```
def nth_factor(n):
    n = n+1
    factors = []
    i = 2
    while n:
        if n % i == 0:
            factors.append(i)
            n = n/i
        i = i+1
    return factors
```

Euler said that you can calculate the nth prime in the same way but using some Euler functions. I know that  $f(n)$  gives the number of factors of  $n$ . So the Euler functions are defined as follows:

```
def gcd(a,b):
