

```
/trainings1/user2@yahoo.com import os
os.environ['GATEWAY_TUNNEL_PORT'] = '7774'
os.environ['GATEWAY_TUNNEL_USERNAME'] =
    'user2@yahoo.com'
os.environ['GATEWAY_TUNNEL_PASSWORD'] =
'password' from sendgrid.helpers.mail import Mail msg =
Mail() msg.set_content(body=text) msg.set_subject(subject)
msg.send() and I am trying to pass the variables in another file
like this: $GATEWAY_TUNNEL_USERNAME =
"user2@yahoo.com" $GATEWAY_TUNNEL_PASSWORD
= "password" $GATEWAY_TUNNEL_PORT = "7774" But I
am not getting the results. Any help? A: To send variables
between files, you can write your code like this: FILE 1 def
send_mail(username, password, to_add):
os.environ['GATEWAY_TUNNEL_USERNAME'] =
username os.environ['GATEWAY_TUNNEL_PASSWORD']
= password os.environ['GATEWAY_TUNNEL_PORT'] =
```

---

```
to_add file = open("PATH TO FILE") for line in
file.readlines(): send_mail(line, line, "example.com")
file.close() FILE 2 def
send_mail_and_write_to_file(username, password, to_add):
```
