The Legend of Bhagat Singh 720p English Subtitle (Hindi) - [HD/DVD] Rated 5 out of 5 by snharr From the very beginning of this film you can tell it was made with love. The film has lots of great background music (all the popular Bollywood songs of the time) as well as really catchy theme songs. I had never heard of Bhagat Singh before watching this film, but the film caught my interest enough to seek out more information about this revolutionary. It is easy to tell that the film makers know their subject very well. They incorporated all of Bhagat's photos, writings, and quotes into the film without altering the story too much. The documentary style does slow down the film a bit, but the filmmakers' use of clips from other Bollywood films really helped to keep this movie focused. The only problem I had with this film was the English subtitles. I had to look up some words and I would have liked to have been able to read the Hindi subtitles along with the English. I would recommend this film to anyone who loves Bollywood and enjoys a good story about a revolutionary. The history of this film and the great music and cinematography, really make this a must see. 1 review for The Legend of Bhagat Singh 720p English Subtitle (Hindi) Updates on the The Legend Of Bhagat Singh 720p movies: Add to List. Download Mp3 DDL Apk For Free and also watch movie in 1080p qualityQ: How to display new records only after all data has been stored in the database? I've got a gridview on a asp.net web page that is bound to a dataset. The table to which the gridview is bound contains a field that takes the current timestamp and I've set up my Linq-To-Sql query to only return results that are newer than the timestamp I'm bound to. The problem I'm having is that it always returns the old data. In the Data-Bound Control I've set the DataSourceID of the gridview to the table in the database that the gridview is bound to. Here is my Linq-To-Sql query that I'm using to retrieve the data: var query = from a in _context.Table where a.ItemDate >= AppState.Current.Timestamp orderby a.ItemDate ascending select new { a.SomeField1, a.SomeField2 }; dataSource = query.ToList(); grid = new GridView { DataSource = dataSource, AllowPaging = false, AllowSorting = false, AutoGenerateEditButton = false, AutoGenerateDeleteButton = false }; grid.DataBind(); Thanks for any help. A: You are returning the actual table a which has no relationship to the item in your LINQ query so it is always returning the old data. You need to change the query to return a row of some sort that you can use to determine what records were newly added. if you need to see what has changed, you can always query the whole table. if you need to see only newly added records you can pass in a timestamp and run a query. var query = from a in _context.Table where a.ItemDate >= AppState.Current.Timestamp orderby a.ItemDate ascending select new { a.SomeField1, a.SomeField2 }; var rows = query.ToList(); var timestamped = Date 2d92ce491b
