Analyze the HomeMatic devices and their communication to other devices, for troubleshooting and based on a theoretical PC sniffer. A simple tool based on a small ESP32, UART and CCU interface, with a software sniffer. See what a telegram looks like, and what a telegram means. On the hardware front, the unit will be equipped with a simple display and filter, for monitoring. Analyze your signal conditions and find out what's going on with your HomeMatic network. The analyzer will calculate the duty cycle and noise of the devices, for a particular time period. The remote nodes' RSSI will be displayed as well as a threshold alert, when the RSSI reaches a specific level. While the unit will be equipped with a simple display, a computer will be connected, with which the analyzer will transfer the sniffer data. Also the hardware is designed for a low power consumption. The IC used is a combined ESP32 and UART module. A 3.3V 2W power supply will be used. A PCMCIA interface will be provided for installation. The setup is quite simple and it does not require any extra devices. AskSin Analyzer XS Online Documentation: You will find the documentation online here: If you want to have a look at an old version, Documentation older than version v1.10 (01-01-20): AskSin Analyzer XS Features: - Verified and tested as of the date of this release - Can be connected to the HomeMatic devices - Logging, tasking and tracing - Analyzes an entire telegram, as well as the monitor channels - Includes CPU utilization - Shows the RSSI of the RSSI in the channel - Raises a threshold alert when the RSSI exceeds a certain value - Includes a display and filters - Fits in the sub-frame format, of a HomeMatic CCU - Supports machine and video modes - In / OUT and I2S audio connections, as well as COM ports - Works via both UART, and IR transmitter/receiver - Supports the SCLK of both P1 and

P2 domains, both on and off to the device - Supports both a 09e8f5149f

===== Once the devices are installed and working, each communicating with the central control unit, we will move to the next step: the setup of the analyzer. The analyzer contains four main pieces: a mini-SD card reader, a central control unit (CCU), a “Named” board, and its application software, on an ESP32 device. Within the analyzer, we will create an instrument, which will perform the following functions: ● Telegrams decoding and analysis ● Operation and recording of RSSI (signal strength indicator) and duty cycle ● Overview of the firmware, of the central control unit (CCU) and of the connected HomeMatic (HM) devices. ● Data export ● Serving as a troubleshooting base, for all the HM devices ● Reporting of HM and FHEM (firstly) lights ● Reporting of HM and FHEM (firstly) sensors ● Reporting of HM and FHEM (firstly) toggle switches ● Reporting of HM and FHEM (firstly) motors ● Reporting of HM and FHEM (firstly) cameras ● Reporting of HM and FHEM (firstly) sensors ● Reporting of HM and FHEM (firstly) thermostats AskSin Analyzer XS Features: ===== ● Data storage ● Capacity of the analyzer is as follows: 10 devices (IPs + HM + FHEM), 200 telegrams ● Storage is not encrypted ● PDF report export ● Streaming of data to a cloud platform ● Usage of the UART interfaces ● Traffic analysis ● Telegrams decoding ● Reporting of HM and FHEM (firstly) lights, HM and FHEM (firstly) sensors, HM and FHEM (firstly) toggle switches, HM and FHEM (firstly) motors, HM and FHEM (firstly) cameras, HM and FHEM (firstly) thermostats ● Video overlay of image data, of the aforementioned elements of the home automation environment ● Command line tool to perform the operation of the analyzer ● Monitoring of the CCU and HM device operation, CCU or HM firmware version, firmware update date, CCU power monitoring, and device power and operation status ● Monitors of the CCU, HM, and FHEM lights, power, or state ● Monitoring
