I tried hard to make it work with my enigma2. On my system it didnt work with that. Thanks for your support!Ã .Alterface Unveils HTML5 Access for eLearning Alterface, a leading provider of online training and distance learning content, unveiled its new HTML5-based Web platform for the delivery of eLearning and online learning courses. The long-awaited HTML5-based platform received a significant update last month, Alterface added native support for HTML5 video, audio, and animations while providing an improved user experience. "The new platform aims to give web learners a truly native web experience," said Alterface CEO Steve Gross. "HTML5 is the current standard for development, and as online eLearning becomes more ingrained in the global education infrastructure, a learning experience optimized for the web will be more important than ever." The Web platform is complemented by Alterface's existing eLearning authoring environment, and is easily integrated with its core eLearning content management and delivery system. The new platform also is fully compatible with Adaptec's Adaptive Learning System (ALS) and other third-party eLearning authoring tools. "The new platform will provide a native web experience to learners with the use of Web 3.0 web technologies such as HTML5, JavaScript, and CSS," said Adaptec Vice President of Sales & Strategic Alliances Rich Jayne. "Those Web technologies provide the benefits of a true native Internet application including file browsing and interaction with the learner through native browsers. We are pleased to be able to provide HTML5 eLearning and eLearning authoring tools that support the additional capabilities of Web 3.0." The new platform is now available as a free download for Alterface eLearning and ALMS customers.Awarded on April 24, 2015, this permanently deactivated as of 09:12 (GMT +8) They

Brands Categories Your Email * Your Name * About IPKFinder IPKFinder uses a team of crackers and human factors in-house to ensure that it's able to accurately distribute and promote content on behalf of publishers across all platforms and services that qualify. Pediatric unintentional injury is a significant public health burden, accounting for 1.6 million emergency department (ED) visits annually and more than 40,000 hospitalizations. Pediatric falls are among the top 10 most common types of unintentional injury in the US, resulting in 45 deaths, over 1.7 million emergency department visits, and over 100,000 hospitalizations annually. In addition, these injuries are more likely to be serious if they occur in school or other public places. Pediatric falls occur more frequently in the afternoon, and physical, cognitive, and psychosocial factors can vary significantly by time of day. The prevalence of unintentional falls in children aged 3-19 decreases with age, but increases from 15% to 28% from grades K-3 to grades 6-12. Furthermore, the prevalence of unintentional falls in 12- to 20-year-old students is 17%. The lack of adequate prevention and intervention, especially in low- income areas, underlines the importance of identifying potentially modifiable risk factors. Primary caregivers (e.g., parents, guardians) are commonly interviewed as proxy reporters of children's activities. However, a quantitative evaluation of the agreement between self-reported and observed falls in young children is lacking. Furthermore, previous research on fall prevention and intervention in pediatric populations focused on institutional settings, which is important because falls are more common in children in the community. To address this gap in the literature, we propose a retrospective study of more than 2000 children aged 3-5 who were seen in an urban hospital ED following an unintentional fall. We will compare self-reported data on fall risk factors (e.g., living in an apartment with a cat, in-law apartment) to fall data (e.g., observed at the event or retrospectively determined from the medical record) by time of day (morning, afternoon) and by observed injury pattern (contusion, laceration, fracture). In addition to objective fall data, we will also examine caregiver reports of child characteristics (e.g., age, sex) and caregiver confidence in reporting falls accurately. The purpose of this study is to characterize the discrepancies between self-reported and observed fall risk factors in elementary school- 1cdb36666d
