The aim of this study was to determine the presence of an association of the A/B-crystallin(s) complex with triosephosphate isomerase (TPI) in diabetic individuals, and to further confirm their interaction. The interaction between alpha-crystallin with TPI was studied by means of transient transfection and co-immunoprecipitation, in co-immunoprecipitation assays and in an immunoprecipitation assay, using a TPI expression construct. In in vitro experiments with tobacco leafs, a TPI-alpha-crystallin complex formation could be demonstrated. A novel complex between TPI and A/B-crystallin, which is composed of a small proportion of A-crystallin and a more abundant, intermediary or heterogeneous form, could be detected by Co-IP and immunoblotting. The interaction of A/B-crystallin with TPI was confirmed. By using a TPI expression construct in in vitro experiments, association of TPI with this complex could be demonstrated.
